PROBLEM: THE NEED FOR A BETTER MAINTENANCE PARADIGM

Preventing asset failures and accidents is critical for offshore oil and gas operators. Asset failures are expensive events that can cost millions of dollars in deferred production and repairs, as well as grind operations to a halt for extensive periods of time. Just 12 hours of downtime for a 200K bpd offshore production platform can result in $6-8M of deferred production opportunity. That doesn’t include the cost of labor, the need for new parts, or the cost of damage to the company’s public image. Today, most offshore platforms have already invested in sensors across their operations that generate massive volumes of data. By making better use of the data they already have, offshore operators can switch to a predictive maintenance approach, allowing them to predict and prevent asset failures before they occur.

Predictive maintenance uses machine learning algorithms to ingest historical sensor data from a facility’s operations. This data is then used to build a model that acts as a profile of what normal operations look like. The normal behavior model can then analyze asset sensor data in real time, and identify and flag any values that deviate from this established norm. Using historical sensor data and added knowledge from subject matter experts (SMEs), this model can pinpoint when and how a failure will occur rather than simply warning that a component is at risk. Operators are then able to plan timely maintenance and avoid excess downtime or catastrophic failures.

To offer an analogy, predictive maintenance is akin to having a wearable medical device, like a wristband, constantly scanning a patient’s body, examining every aspect of their health as they go about their day, and continually assessing the results in real time.

SOLUTION: AI-POWERED PREDICTIVE MAINTENANCE

The best way to truly derive value from predictive maintenance is by using an AI-powered solution such as SparkCognition Industrial AI Suite. Predictive maintenance can be (and has been) done without the use of artificial intelligence (AI) and machine learning (ML), but machine learning alleviates—or even eliminates—many of the difficulties associated with traditional predictive maintenance.

This device could then inform the patient that they need to see a doctor for medical treatment to avert a heart attack that will otherwise take place on a specific date. In the same way, the proactive diagnosis of offshore asset health would allow upstream operators to anticipate and address failures before they occur.

SOLUTION: AI-POWERED PREDICTIVE MAINTENANCE

The best way to truly derive value from predictive maintenance is by using an AI-powered solution such as SparkCognition Industrial AI Suite. Predictive maintenance can be (and has been) done without the use of artificial intelligence (AI) and machine learning (ML), but machine learning alleviates—or even eliminates—many of the difficulties associated with traditional predictive maintenance.
**Addressing speed and scale**
Predictive maintenance requires large amounts of data at a scale that is cumbersome and prohibitively time-consuming for human analysts.

Machine learning can unlock the insights in this data quickly, efficiently, and accurately. Industrial AI Suite analyzes large volumes of data, identifies anomalous behavior, and understands causal relationships using advanced unsupervised learning techniques. This system provides operators with faster insights into asset failure prevention for any size of operation.

**Alleviating the cost and burden of model upkeep**
Another problem machine learning addresses is maintaining models over time. With traditional predictive models that don’t employ AI, a change in even a single variable, such as a replaced part, necessitates reworking the entire model. This also applies to the normal changes an asset goes through over time as it is used; a pump that has been in service a long time will not perform the same as when it was brand new.

Machine learning models avert these problems because they dynamically learn and maintain themselves by adjusting to any component or asset and adapting to changes over time.

**Overcoming the lack of sufficient, structured data**
Not all systems or subsystems have the sensors to provide the amounts of data predictive maintenance requires. Machine learning alone can’t solve this dilemma, but ML-powered natural language processing (NLP) can. Most software can only analyze structured data or data containing numbers or categories.

AI-powered NLP platforms, like NLP Studio, can decipher and use unstructured data as well—be it PDFs, books, journals, audio, video, images, notes, analog data, or any other source imaginable. This capability is valuable for offshore operators because, with NLP, predictive maintenance models can use data sources beyond sensors. This includes all manner of associated data about an asset, such as maintenance records. By extracting facts, figures, entities, and contextual data from an asset’s maintenance history, predictive maintenance solutions outfitted with NLP find causal patterns that indicate potential failures, even in so-called dark subsystems that lack sensors.

**Realizing the potential of predictive + prescriptive maintenance**
While invaluable, predictive analytics are only part of the value machine learning delivers. Predictive maintenance doesn’t absolve operators from the need to perform maintenance. By incorporating NLP technology, industrial asset maintenance solutions can ingest historical records and service manuals, as well as past courses of action taken by subject matter experts. Using this bank of information, the solution can speed up maintenance processes by listing possible next steps and suggesting corrective measures.

**RESULTS: COST-EFFICIENT MAINTENANCE**

| Increased Identification of Unexpected Subsystem Failures by | 75% |
| Increased Failure Identification Lead Time from Hours to | 9 Days |
| Increased Production Efficiency on Offshore Platforms to Nearly | 99% |

**CASE STUDY: PREDICTIVE MAINTENANCE FOR A LARGE FLEET OF OFFSHORE PLATFORMS**

**PROBLEM**
A supermajor with high-volume offshore platforms needed to maximize production potential and improve overall platform safety.

**SOLUTION**
In just two months, Industrial AI Suite was deployed across 20 critical subsystems to predict impending failures and optimize maintenance activities.

**RESULTS**
The customer improved annual production by 4%, or up to $30M annually per platform.

**ABOUT SPARKCOGNITION**
SparkCognition’s award-winning AI solutions allow organizations to predict future outcomes, prescribe next actions, empower people, and protect assets. We partner with the world’s industry leaders to analyze, optimize, and learn from all types of data, augment human intelligence, drive profitable growth, and achieve operational excellence. Our patented AI technologies include machine learning, deep neural networks, natural language processing, generative AI, and computer vision—enabling productivity, innovation, and accelerating digital transformation. Our solutions solve critical problems, prevent unexpected downtime, maximize asset performance, deliver net-zero initiatives, proactively address safety, and prevent cyberattacks.

To learn more about how SparkCognition’s AI solutions can unlock the power in your data, visit www.sparkcognition.com.
